```

# 流程圖

```
package com.example.demo1;
```

```
public class Monster {  
    private int hp;  
  
    public Monster() {  
        this.hp = 100;  
    }  
    public int getHp() {  
        return this.hp;  
    }  
    public int attack() {  
        return (int)(Math.random() * 11 + 8);  
    }  
    public void takeDamage(int damage) {  
        this.hp = Math.max(0, this.hp - damage);  
    }  
}
```

# 怪物

---

- 怪物生命值，初始為 100
- 傳回目前生命值
- 隨機產生 8~18 的攻擊力
- 受到傷害並扣除血量（最少為 0）

# 玩家

- 玩家生命值，初始為100
- 玩家是否正在防禦，初始為未防禦
- 傳回目前生命值&防禦狀態

```
package com.example.demo1;

public class Player {
    private int hp;
    private boolean defending;

    public Player() {
        this.hp = 100;
        this.defending = false;
    }

    public int getHp() {
        return this.hp;
    }

    public boolean isDefending() {
        return this.defending;
    }
}
```

```
public void setDefending(boolean defending) {  
    this.defending = defending;  
}  
  
public int attack() {  
    return (int)(Math.random() * 11 + 10);  
}  
  
public int heal() {  
    int amount = (int)(Math.random() * 6 + 10); |  
    this.hp = Math.min(100, this.hp + amount);  
    return amount;  
}  
  
public void takeDamage(int damage) {  
    if (this.defending) {  
        damage = damage / 2;  
    }  
    this.hp = Math.max(0, this.hp - damage);  
}
```

## 設定防禦狀態

- 隨機產生10~20 的攻擊力
- 隨機回復 10~15 點生命值
- 如果正在防禦傷害值會減半  
然後從 hp 中扣除傷害，最低為 0

# 控制

```
package com.example.demo1;  
import org.springframework.web.bind.annotation.*;  
  
@RestController  
@RequestMapping("/game")  
@CrossOrigin  
public class BattleController {  
  
    private Player player = new Player();  
    private Monster monster = new Monster();
```

- 表示這是一個 REST API 控制器，回傳的是 JSON 而非 HTML 頁面。
- 所有路徑會以 /game 開頭，例如 /game/action
- 允許前端網頁跨網域呼叫此後端 API
- 建立玩家和怪物的實例

```
@PostMapping("/action")
public Map<String, Object> playerAction(@RequestParam String type) {
    Map<String, Object> result = new HashMap<>();
    int playerDamage = 0, monsterDamage = 0, healAmount = 0;
    player.setDefending(false);
    switch (type) {
        case "attack":
            playerDamage = player.attack();
            monster.takeDamage(playerDamage);
            break;
        case "defend":
            player.setDefending(true);
            break;
        case "heal":
            healAmount = player.heal();
            break;
    }
}
```

- 當玩家透過 POST 請求，系統會根據 type 處理動作，傳回一個 JSON 結果
- 每回合預設關閉防禦
- 隨機造成 10~20 傷害，怪物扣血
- 開啟防禦，減半怪物下回合攻擊力
- 隨機回復 10~15 HP

```
if (monster.getHp() > 0) {
    monsterDamage = monster.attack();
    player.takeDamage(monsterDamage);
}
result.put("playerHp", player.getHp());
result.put("monsterHp", monster.getHp());
result.put("playerDamage", playerDamage);
result.put("monsterDamage", monsterDamage);
result.put("heal", healAmount);
result.put("defending", player.isDefending());
if (player.getHp() <= 0) {
    result.put("status", "lost");
} else if (monster.getHp() <= 0) {
    result.put("status", "won");
} else {
    result.put("status", "ongoing");
}
return result;
}
```

- 怪物攻擊 (8~18 傷害)
- 玩家扣血 (若有防禦減半)
- 玩家、怪物剩餘 HP
- 玩家、怪物本回合造成的傷害
- 玩家回血值
- 玩家是否在防禦狀態
- 玩家死亡、怪物死亡、繼續遊戲

```
@PostMapping("/reset")
public String resetGame() {
    player = new Player();
    monster = new Monster();
    return "Game reset.";
}
```

- 重設整場戰鬥，讓玩家與怪物都回到滿血狀態

DENCO

# 遇到的困難

© Rex / Everett / Rex Features

- 第一次接觸spring boot

- 添加普攻、技能

- 新增怪物

謝謝大家聆聽！
